TITLE: The Bactericidal Action of Ionizing Radiations

PERIODICAL: Zhurnal mikrobiologii, epidemiologii i immunobiologii, 1959, Nr 6, pp 62-66 (USSR)

ABSTRACT: This was first presented at the conference of the Otdel radiatsionnoy mikrobiologii (Radiation Microbiology Department) on May 5, 1958. Intensive doses of ionizing radiations will kill microbes. As M.N. Meysel' and N.D. Chernyayev have pointed out, radiation doses sufficient to kill the vegetative forms of microbes are not bactericidal for the spore forms. N.A. Golovkin has pointed out that the sterilizing effect of radiation depends both on the radiation dose and on the density and volume of the irradiated suspension. Ye.N. Sokurova showed that the physiological state of the cells at the time of radiation has an essential effect on the radiation-sensitivity. The most sensitive cells are those in the logarithmic stage of growth. For the present tests, to determine the bactericidal effects of ionizing radiations, the following microbes were used: Escherichia coli, Proteus, Staphylococcus, hay bacillus and Sarcina. Irradiation was performed in an experimental BGO-2

Card 1/2

The Bactericidal Action of Ionizing Radiations

SOV/16-59-6-13/46

gamma-ray unit using radioactive cobalt with a total activity of 5 kilocuries. The dose was 600 r/min. The results showed that the bactericidal action of the ionizing radiation varied directly with the concentration of microbe bodies per ml of irradiated medium. For full sterilization of thick (40-50 billion bodies/ml) suspensions of the microbes in the vegetative form, a dose of 400,000-600,000 r was needed; for the spore forms - 1,500,000 r. The most resistant of the microbes to X-ray radiation were the Sarcina and hay bacillus which perished after a dose of 1,500,000 r in a suspension of 40 billion bodies/ml. The most sensitive was Escherichia coli which was sterilized by a dose of 400,000 r in the same suspension. Staphylococcus was sterilized at 800,000 r. There are: 4 figures and 13 references, 5 of which are Soviet and 8 English.

AUTHOR: Yesayan, G.S., Candidate of Biological Sciences (Yerevan)

TITLE: More Fruit Trees in Roadside Plantations (Bol'she plodov-ykh derev'yov v pridorozhnyye nasazhdeniya)

PERIODICAL: Priroda, 1958, Nr 10, pp 101-102 (USSR)

ABSTRACT: The article deals with the need for the planting of fruit trees wherever possible along roads in Armenia. These would serve both as snow-, sun- and wind-breaks and at the same time give a valuable yield of fruit. Attention must be paid to soil and climatic conditions of the various sections of the road in choosing suitable varieties of fruit tree. Some examples where such planting has been carried out in Armenia are given. The author stresses the value of walnuts as a food. There is 1 photo.

Preparation of hexachloroethane and carbon tetrachloride from 1,2-dichloro-2-butene. A. N. Akopyrin, G. T. Pasyan, and V. Martinyan. *Zhur. Priklad. Khim.* (J. Applied Chem.) 21, 146-60 (1948).— C_2Cl_4 and CCl_4 are obtained in 1 step by destructive catalytic chlorination of $CH_3CH=CH-CCl_2CH_3$. The heat conditions are activated C as catalyst at about 450° ; the total yield is as high as 80%. No side products are formed and the outgoing gas is HCl with about 20% Cl, the latter being usable for preliminary chlorination of the dichlorobutene to 1,2,3,4-tetrachlorobutane which in itself is a suitable starting material. During the process quite pure HCl is obtained. For the highest yield (80%) the feed rate of Cl was 10 l./hr., of dichlorobutene 3.3 g./hr., and the yields of C_2Cl_4 and CCl_4 70 and 11 g., resp. Below 450° or with rapid charging of the starting materials 2 unidentified substances were also formed, a liquid b.p. $202-5^\circ$, and crystals m. 225° . Kitty Lus

"Zhur Prik Khim" Vol XXI, No 2

Destructive chlorination of 1,3-dichloro-2-butene, formed as a by-product of hydrochlorination of monovinylacetylene to chloroprene, was carried out in the presence of activated carbon at 450°C at rates of flow of chloride of 20-22 l/hr and dichlorobutene of 5.3-5.7 g/hr (20% excess chlorine) and gave an average of 73%, and up to 80%, theoretical yields of products, among them about 75% hexachloroethane and the rest carbon tetrachloride. Increase of temperature to 600° probably would raise the yield of carbon tetrachloride.

"Synthesis of Arylbutadienes," V. I. Isagulyants,
Act Mem Acad Sci Armenian SSR, G. T. Esayan, Chem
Inst, Acad Sci Armenian SSR

"Dok Ak Nauk SSSR," Vol LXXVI, No 4, pp 531-534

Action of powd potassium hydroxide on 1-aryl-3-
chlorobutenes-2 (I) leads to 1-arylbutadienes-1,3.
Latter may prove useful as starting materials for
prepn of high-mol polymers, although they have
strong tendency towards dimeric cyclization.
Action of alcoholic KOH on I results in 1-aryl-3-
ethoxybutenes.

178T16

10

Chem A

Synthesis of arylbutadienes. V. I. Izrael'skiy and G. I. Bayan. Doklady Akad. Nauk S.S.S.R. 70, 611-1 (1951). Reaction of 1-aryl-3-chloro-2-butenes with powdered KOH yields 1-aryl-1,3-butadienes, primarily via the formation of acetylenic analogs and the allene-butadiene rearrangement. Use of alc. KOH yields the ethoxybutenes arrangement. As solvents for the reaction one may use CCl₄, MePh, Vasoline Oil, etc.). The best yield of Ph-CH=CH-CH=CH₂ monomer, 21-25%, b.p. 70-1°, n_D²⁰ 1.5088, d₄²⁰ 0.9277, is obtained in boiling MePh with excess KOH; simultaneously 25-30% dimer forms. Addn. of CuI₂NH₃ as stabilizer did not affect the yield. The monomer forms the dibromide, m. 80-90°, and the tetrabromide, m. 111-112°, while with maleic anhydride it yields 3-phenyl-tetrahydrophthalic anhydride, m. 110-111°, which hydrolyzes to the free acid, m. 190-191°. Thus the monomer appears to be the trans-isomer. The liquid dimer, b.p. 180°, n_D²⁰ 1.5088, d₄²⁰ 1.0327, forms a tribromide, m. 221-222°. In addn., a solid, C₁₆H₁₄, also forms in the reaction in unspecified yield. Reactions with substituted analogs were less facile, and excess KOH and long heating periods were needed; hence the butadienes (monomers) were isolated only in 12-18% yields, and their dimers in 35-60% yields. Possibly the monomers were trans structures. Thus, the following were obtained: 1-(p-tolyl)-1,3-butadiene, b.p. 81-82°, n_D²⁰ 1.5532, d₄²⁰ 0.9270; dimer, b.p. 207-10°, n_D²⁰ 1.5702, d₄²⁰ 0.9905; adduct of monomer with maleic anhydride, 3-(p-tolyl)-Δ⁴-tetrahydrophthalic anhydride, m.p. un- stated (free acid, m. 200-1°). 1-(p-cumyl)-1,3-butadiene, b.p. 105-6°, n_D²⁰ 1.5400, d₄²⁰ 0.9050; dimer, b.p. 238-41°, n_D²⁰ 1.5518, d₄²⁰ 0.9680; 3-(p-cumyl)-Δ⁴-tetrahydrophthalic acid, m. 205-6°. 1-(Naphthyl)-1,3-butadiene, b.p. 130-41°, n_D²⁰ 1.6218, d₄²⁰ 1.0020; dimer, b.p. 270-3°, m. 204°. Monomeric with 3 moles of maleic anhydride could not be isolated, but the dimer b.p. 208-74°. In all reactions polymers were formed; these on drying formed strong elastic films. G. M. Kondajoff

1951

allowing to stand for 24 hours and then pouring into a mold. The mold is a rectangular box of wood, 10 in. long, 4 in. wide, and 2 in. high. The mold is filled with the mixture and the top is covered with a piece of paper. The mold is then placed in a warm place and the mixture is allowed to dry for 24 hours. The dried mixture is then removed from the mold and is ready for use.

Title : Concerning the Oxidation of Cyclo-Octatetraene to Terephthalic Acid.

Orig Pub : Zh. obshch. khimii, 1956, 26, No 2, 599-600

Abstract : Oxidation of cyclo-octatetraene (I) with CrO_3 results in the formation, together with the terephthalic acid (II) and $\text{C}_6\text{H}_5\text{CHO}$ (III), of a large amount of $\text{C}_6\text{H}_5\text{COCH}$ (IV) (cf. Reppe W. et al., Liebigs Ann. Chem. 1948, 560, 1). To 1 g of I in 100 ml glacial CH_3COOH is added a 33% solution of CrO_3 in 75% aqueous CH_3COOH . The reaction mixture is diluted with water and extracted with ether, and the ether extract is treated with 5% solution of NaOH . From the ether layer is recovered III. To the boiling alkaline layer is added a solution of H_2SO_4 . The precipitate that is obtained is weighed and
